INSTRUCTIONS FOR USE OF BEST YET SOLUTION

The following data will instruct you on how best to use your purchase of BEST YET solution for control of Fleas, Ticks, Mites, Bed Bugs, Chiggers, Silverfish, Roaches, Ants, Carpet Beetles, Springtails, Scorpions, Spiders, Mosquitoes, Flies and a array of other non beneficial insects. BEST YET can be used on any surface area including skin, hair, cloth or leather furniture, wood, hardwood floors, tile and linoleum floors, clothing, mattress and box springs, carpet, kitchen counters and inside cupboards and pantry areas. It also makes an excellent furniture polish. BEST YET is formulated with food grade EPA and FDA approved compounds that are safe to use on anything **EXCEPT PLANT LIFE**. It will not stain or attract dirt. Feel free to use it liberally as a liquid, mist, or with a NON THERMAL ULV fogger, depending on your objective. The following will suggest a proper protocol for application of BEST YET for one or more of the animal health or insect control endeavors you may be contemplating. **BEST YET is a READY TO USE solution and cannot be diluted.**

FOR TREATMENT TO THE STRUCTURE

Apply BEST YET on the floor, mop boards or floor molding, rugs, carpet, mattress and box spring, bed clothing, furniture and anywhere else those parasites or other insects might be. It will not stain or attract dirt. I suggest you use a tank type compression sprayer (included in the BEST YET KIT). The commercial type sprayer will make it easier to get in the difficult places such as under furniture, beds etc. It will also provide a consistent delivery of the solution often difficult to do when using a trigger sprayer. Remember, you want to treat all areas as this product is considered a CONTACT KILLER and must either touch the insect or be inhaled by the pest to incur death. The odor of BEST YET is not offensive but somewhat overwhelming for an hour or two when total home treatments are conducted. Given a short amount of time, the atmosphere will evolve into a refreshing clear cedar closet aroma. Wait several days after treatment before cleaning or vacuuming the floor areas. This will give the solution the opportunity to erode and dehydrate the insect egg and larvae in the treated area. Recommended application is 1 gallon per 1000 square foot of treatment area. The aroma of the cedar oil will impair the mental capacities of any "New Hatch" that survives the treatment, and, subsequent death will incur usually within 72 hours or less. It is imperative that the total structure be treated to insure there is no reoccurrence of the pest. Parasites such as Fleas will often move from one area to another, such as from basements to other levels. Walking the treated area after treatment wearing white socks will usually expose any areas harboring fleas, as the flea will be attracted to white. Areas where this occurs should be re-treated immediately to eliminate the egg layer cycle and eliminate the next generation of flea.

FOR TREATMENT OF THE ANIMALS

BEST YET is considered a contact killer. The objective is to apply a mist or spray directly on the flea or in the alternative, close enough to it that it can breathe the mist from the sprayer. All insects breathe through their body and when their many breathing pores are exposed to the solution, it triggers a suicide response by commanding the closure of the arthropods breathing pores. Insects must have the available heat found in air to survive, or their internal organs immediately cease to function creating instant death. Use the product liberally the first time making the animal wet with the solution. You will observe fleas falling from the animal at once. Take a moment and make sure the feet, leg pits, groin, belly, neck, tail and rectum are treated well. Cedar Oil is an anti-bacterial and will promote the healing of any sore or dry flaky spots on the Pet often referred to as flea dermatitis. It will also moisten the animals skin with cedar oil, eliminating the dry skin often caused naturally or by bathing the animal. **JUST A FINE MIST ON CATS AS THEY MAY INGEST IT WHILE GROOMING.** You will find that this process will stimulate the animals hair making it healthy and attractive. As with any repellent, human or animal, repeat applications depend on exposure to insects. Keep your Pets feet, legs and underbelly treated with a spray prior to entry into flea infested areas. This will help eliminate the fleas that insist on hitching a ride on the animal and returning to your home. Repeated liberal applications on a daily basis to HOT SPOTS or MANGE areas will trigger the mite demise and hair growth will resume immediately. An application into the ear canal with a subsequent external ear massage will destroy any ear mites or chronic fungal organism issues the animal has in that part of its body. **IT IS IMPERATIVE THAT NO AREAS ARE LEFT UNTREATED.**

TREATMENT FOR BED BUGS

Using The hand held compression sprayer, discharge a mist of BEST YET SOLUTION on the horizontal and vertical surface of the linen stripped mattress, box spring and headboard of the beds. Using the same procedure, spray the furniture in the room with the same type mist, the objective being that of triggering an INSTANT KILL to the bed bugs, mites and fleas at large. Roll back any seams or material tucks of the mattress or box spring and liberally treat those areas with additional spray. Remove the cushions from any furniture and treat the bottom sides and the cushions well. Chairs with cloth cushions should be treated on the bottom side as well as the top. Using the compression sprayer that is dispersing a fine mist of BEST YET, treat each and every square inch of horizontal floor surface area including but not limited to the carpet, tile and wood floor areas. Spray the mop boards first and any drapes and curtains to at least 24 inches from the floor. Work backwards from the farthest point of the room making sure a liberal amount of the solution is being applied to all areas. It is imperative that no area be left untreated. Spray the legs of all furniture and any lamp posts or other vertical supports. Treat any and all dresser or vanity areas with a light spray. Remember, Bed Bugs are nocturnal and are difficult to find in the light. It is extremely important to treat the box spring cavity located on the bottom of the bed. Remove the fine mesh cob web netting to gain access to the spring area. Treat this area liberally as it is often the main hiding place for bed bugs. CAUTION: WILL MAKE SURFACE SLIPPERY UNTIL DRIED.

TREATMENT USING A ULV NON THERMAL FOGGER MACHINE - REMOVE ALL ANIMALS, REPTILES AND BIRDS.

Fill the fogger reservoir with the ready to use BEST YET solution. It is suggested that an adjustable VMD (volumetric mean diameter) Tri-Jet Fogger be used to facilitate both dry and wet fog applications. This adjustment will enable the operator to adjust the size of fog droplet being discharged from the fogging machine. Prior to fogging it is suggested that the seams and tucks of the mattress and any other cloth material be rolled back and treated with a mist or spray. The mattress should be removed from the bed so that both sides and total coverage of the surface can be treated. Using a dry to medium wet fog discharge, treat directly on the mattress, box spring and headboard. Repeat the same application to all cloth covered furniture insuring that at minimum, a slight dampness of solution is detectable. Working backward from the far end of the room, and aiming the fogger at the floor areas, disperse a wet fog over all Carpet, wood flooring and tile areas. Be sure to direct the fog under furniture and into corners and at least twenty four inches up from the floor area of any drapes in the room. Disperse a fog directly into any cupboards, drawers or closets. The amount of approximately 1 gallon of solution per one thousand square foot of surface area is suggested to insure a 100 % elimination and prevention of immediate re-infestation of insects. For control of mites, start in attic and work downwards level by level. It is necessary to fog all drapes, curtains and closet clothing. Be sure adequate amounts of BEST YET are discharged into the air of each room. Remove the furnace filter from the cold air return and with the air handler circulating air throughout the structure discharge into the return air cavity. This will circulate the fog throughout the structure killing all bacteria and dust mites in the duct work leading to all areas of the home. Before leaving the room, start the air conditioner unit or air circulator and allow it to circulate the air in the room. This will eliminate any dust mites in the AC system. Replacing the filter is recommended. It is suggested that each room be closed and the fog allowed to settle for approximately 2 hours before occupation. Any overwhelming aromas will dissipate in a matter of 6 hours. The structure can be aired out if desired but it is suggested it be kept closed for at least two hours after treatment to enable a pheromone interruption event to impair and destroy the insects mental capacities and triggering their subsequent death.

Best Practices in Treating and Controlling Bed Bugs Using The CedarCide Fogger Machine and Best Yet Bed Bug Killer Spray
Three Highly Recommended CedarCide Tips For Successful and Non Toxic Bed Bug Removal.

- We highly recommend a two step agenda including a spray treatment for furnishings, appliances, miscellaneous boxes, containers and household Items, all visible cracks, crevices, holes and gaps. Followed by a complete structure fumigation including attic space with the CedarCide fogger machine. Best Yet Bed Bug Contact Killer Spray is used in both steps.
- Plan on treating at least twice for total elimination, especially when dealing with heavy infestations. The nice thing about using a non-toxic, natural bed bug contact killer like Best Yet, is that you can't over treat.
- Your attention to detail and thoroughness during treatment are critical to achieve 100% mortality of the bed bug invaders.

Complete Steps 1 Through 3 IN ONE DAY.

CedarCide's Best Practices Include 4 Basic Steps

Step 1- Pre-Treatment/Bag, Wash and Dry Laundry

Step 2- Inspection/Spray Treatment

Step 3- Complete Fumigation with The CedarCide Fogger

Step 4- Re Inspect and Repeat Treatment as Needed.

Step One- Pre Treatmen/Laundry

- Strip all bedding, sheets, blankets, pillow cases etc., along with any laundry found on the floor of infected spaces, bag, seal and Remove to wash and dry.
- Wash all bed sheeting and clothing on normal cycle, hot water. Dry all items including stuffed animals on "High Heat" dryer cycle (185 degrees) dry for an hour. As an added precaution many hotel and care center customers wash infected linens and clothing using 2 oz of PCO CHOICE Concentrate per load. Fill washer and dryer loads 3/4 full, DO NOT OVERFILL.
- Bag all washed and dried items in a NEW Garbage bags and seal, do not return to treated area until after fogging has been completed.

Step Two- Inspection And Spray Treatment

You don't need a bed bug smelling dog to find bed bugs, just a flashlight, a little curiosity and common sense. Although small, bed bugs are visible to the eye. Generally bed bugs seek out dark and hidden places like cracks and crevices and holes or under folds of tufted furniture and bedding, start with the bed- mattress, box springs, headboard and side rails.

- Move Furniture 2-3 feet away from walls, stand up box springs, headboard, side railing and mattresses against a wall for inspection and Spray Treatment. Inspect all sides of mattress, inspect all buttons, seams and any rips or tears
- Inspect bed frame, box springs, headboard and side railings, inspect and spray treat with Best Yet any furniture located near the beds.
- Turn over furniture items and Spray Treat all cracks & crevices, screw holes and voids inside furniture, especially tufted chairs and couches that have deep folds, spray treat to wet inner folds well. (BEST YET DOES NOT STAIN FABRIC)
- Take all pictures off of wall and spray treat frames and wall hangings with Best yet, wetting all cracks and crevices, Inspect and spray treat cracked wallpaper, areas of peeling paint as well as gaps around door and window frames:
- Gather and carefully inspect all appliances, lamps, etc. to inspect and spray treat with Best Yet.
- Remove any shoes and clothing items from closets, inspect and spray treat with Best Yet as needed. Remember Best Yet will not stain fabrics. Hanging clothes in closets can be left loosely hanging and can be fogged with Best Yet in the next step of the protocol; (reduce the logger VMD to the low setting) Remove all "clutter items off floors, carefully inspect and spray treat with Best Yet.
- Thoroughly Spray treat with Best Yet all Cardboard Hangers, boxes, books, backpacks and other belongings that are suspected as a bed bug hiding places.

Unlike Most Pest Control companies, CedarCide DOES NOT ENDORSE throwing perfectly good furnishings away, rather we recommend treating them thoroughly and non toxically with Best Yet to return these valued and familiar furnishings to use. Obviously, if you have an old torn up and urine stained mattress, it might be best to toss it. Discard items only if they are heavily infested, hopelessly torn or perhaps bed bug fecal stained to the point of spoiling the fabric. Most perfectly good furniture infected by bed bugs can be completely cleansed and saved via treatment with Best Yet.

- Remove and Inspect inside all wall outlet switch plate covers and spray treat with Best Yet into wall voids via wall electrical, cable and other miscellaneous wall outlets, Remember BEST YET is silicon based and not conductive.
- Inspect and Spray Treat with Best Yet along tack strips under carpet perimeter edge and behind baseboards, treat all gaps and cracks.
- Inspect and Spray treat curtains and blinds thoroughly, Curtains may be fogged very effectively with Best Yet.

Step Three- Fogging With Best Yet

- Leave all spray treated items in rooms, open up cupboards, drawers and closets. Temporarily disable smoke alarms (Best Yet's extremely small molecular size is often detected as smoke and can set off smoke alarms) Fill up fogger reservoir with Best Yet and adjust VMD setting on Fogger to Medium. Wear an easy breathing mask during fogging treatment. Fog the entire home, all rooms including the attic. 1 gallon of Best Yet will treat 1,700 square ft. using the medium setting on the fogger machine. Fog all contents in room pointing the fogger into all cracks, crevices, gaps and nooks. Liberally fog directly through the batting on the underside of box springs. Electronic equipment including computers, stereo, TVs, miscellaneous household appliances and musical instruments can be fogger safely with Best Yet.
- Any one inside the home during the fogging protocol needs to wear an easy breathing mask, after creating a dense Best Yet cloud inside each room, including attic and all tubby holes, seal up the house or apartment for a minimum of 2 hours. All other People, including pets, birds and snakes can vacate during fogging. Reopen the house after 2 hours, open windows and doors to air out, the strong smell will dissipate quickly leaving behind a cedar closet fresh smell
- Finally, wipe down all furniture and floor surfaces, the cedar oil component will leave a residual film on wood, tile and countertops; simple wipe down to remove, Best Yet will not stain and is easy to clean up.

Step Four- Re Inspect and Repeat Treatment

- Wait 48 hours, Re Inspect and Repeat steps 1 through 3 as needed.

**RECOMMENDED INSTRUCTIONS FOR FLEA ERADICATION
INDOOR/OUTDOOR, PEOPLE, DOGS & CATS:**

For the animals, people and in the house, use Best Yet (product #4002) as this product will kill the fleas and eggs on contact so, be sure to spray everywhere or they will congregate in the untreated areas and the infestation will be back within 3 weeks. You don't need to soak anything, just a light misting everywhere. (do not use on reptiles)
Best Yet is not meant for use on plant life and cannot be diluted.

BE SURE TO FOLLOW THESE DIRECTIONS COMPLETELY:

For inside treatment using Best Yet; just pour it into a pump-up/compression sprayer and lightly mist everywhere inside and on the animals. Begin with the animals then, get the furniture (sides and cushions of couch and chairs, bedding, etc.) Then, spray entire flooring, even closets and hardwood. (You will not need to spray linoleum or tile flooring but, do spray any wooden baseboards around the floors.

IMPORTANT FACT ABOUT FLEAS: Fleas are some of the most difficult parasites to get under control once there is an infestation. They can jump 3-4 feet and can lay dormant up to 3 months.

BE SURE TO SPRAY EVERY ROOM IN YOUR HOME FIRST! IF YOU LEAVE A ROOM OR EVEN A CLOSET UN-TREATED THAT IS WHERE THE FLEAS WILL CONGREGATE. This will not stain anything, including furniture, drapes, carpeting, clothes, etc. (test silk or satin fabrics before spraying).

VERY IMPORTANT: Begin by spraying the sides of furniture; couches, chairs & cushions, bedding, etc. **THEN, spray the floors (except vinyl or tile floors)** It is imperative to get enough of the Best Yet to spray the entire square footage of your home and furniture as well as any animals you may have. Each Gallon of Best Yet (used in the compression/pump-up sprayer) will cover 1,000-1,200 square feet. For Example: If you start spraying in the middle of a room, the fleas and eggs that get a direct spray will die within 1-3 seconds but, the fleas in the surrounding areas will try to get away from it by jumping on you, your animals, the furniture, etc. So, if you spray those areas first when the flea jumps there it will retreat back to the floor and subsequently die. I also recommend spraying your legs first also so you don't get bit.

FOR CATS: Unlike dogs, cats are constantly grooming themselves and you don't want them ingesting too much of the cedar so, just give them a light misting all over EXCEPT on their face. Spray a little Best Yet in your hands and just rub it on their face. You can also apply Best Yet via eye or ear dropper for ear mites and the fungus thereof. Just do this once or twice per week.

FOR DOGS: Spray liberally everywhere, including the ears via spray, Q-Tip or dropper. You can spray them as often as needed.

OUTSIDE TREATMENT: After spraying thoroughly inside using Best Yet, use PCO Choice (product #8006) with a hose-end applicator outside. Begin by spraying the outside of the house first, getting down to the foundation and/or patio and spray outward. Spray the sides of the house, the eaves, shrubbery & trees as best as you can. Just pull off the little black tab on the hose-end sprayer to get a 20' stream for the eaves. Spray all structures on premise. Fleas are difficult to get rid of so treat all areas where the fleas are. You must treat 2 times outside, within 4-7 days to end the egg-laying cycle. For example; if you spray outside today, do it again within 4-7 days. Afterward, it is just a maintenance issue of once a month or so, depending on the time of year. (FYI: If you do not treat outdoor premises you may get the fleas back inside within 10-20 days as they all come from outside via squirrels, rabbits, coons, etc. Monthly outdoor treatments will keep them from re-infesting your home).

FOGGING: NEVER fog with any product while animals or birds, reptiles, etc. are present inside. Any person inside while fogging must wear a mask included with the fogger machine.

FLAMMABLE: DO NOT USE BEST YET NEAR OPEN FLAME.
